

## **ABSTRACT**

An organizer (10) that includes a housing (12) having a first end (12a), a second end (12b), and a channel (14) extending along at least a portion of the housing (12) between the first end (12a) and the second end (12b). A plurality of retaining members (18) are coupled to the housing (12) using the channel (14). Each retaining member (18) exerts a retaining force upon one or more adjacent retaining members (18). The organizer (10) retains an item placed between adjacent retaining members (18) using the retaining force. The retaining members (18) include a hookless coupling segment (19) for coupling the retaining members (18) to the housing. The housing (12) includes at least one divider (27, 30) along at least a portion of the channel (14) to separate the channel (14) into at least two areas (14a, 14b and 14c).
